

New Release Updates - 7/24/20

 The new Enterprise video platform has been integrated and will be released this weekend. This new video platform provides a faster connection and better video quality on the web platform, the Anytime Patient application, and the Anytime Clinician application.

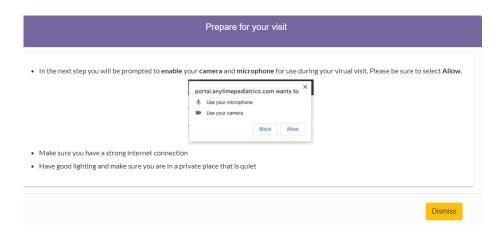

- Full Screen mode now available
 - Right click on the patient screen and select show control
 - o Double click on the screen to allow full screen mode
 - Third party screens can also be enlarged to full screen

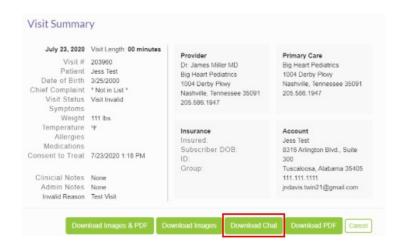

• A pre-visit note has been added to the web to ensure the patients enable their camera and

microphone, check their internet connection, and are in the proper setting for a telemedicine visit.

• The chat from a visit can now be downloaded in addition to images and PDF from the visit summary.

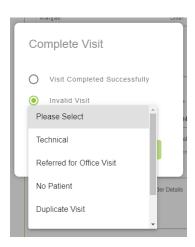

• On the visits page, a visit status drop box has been added. This will allow you to now filter visits by completed, invalid, and cancelled.

You will not be able to deactivate a clinician that has appointments scheduled on the Anytime
Pediatrics platform. The visits will need to be modified before the Clinician can be removed. Users
will now receive a notification message when trying to deactivate a clinician who still has
appointments scheduled.

- You now have multiple options to select for the reason for the invalid visit
 - o If you select other, you will be able to enter a description for the invalid visit.

• The user interface has also been updated with new colors and fonts. This will help clinicians and admins easily read the script on the platform.
